U S NAVY RESPONSES TO U S EPA REGION V COMMENTS ON THE DRAFT FINAL
INTERIM MEASURES WORK PLAN FOR UNEXPLODED ORDNANCE SITE 7 OLD RIFLE
RANGE AND TRAP RANGES NSA CRANE IN

11/12/2013

TETRA TECH

RESPONSES TO USEPA REGION 5 COMMENTS DATED 08/08/13 ON
DRAFT FINAL INTERIM MEASURES WORK PLAN
UXO 7 – OLD RIFLE RANGE AND TRAP RANGE
DATED JULY 2012
NSA CRANE

Comment 1:

The last sentence on page 1-2 referring to the Old Pistol Range makes the statement that they have been approved for no further action. EPA approved the IMR, but I don't recall there being an NFA approval issued for the OPR.

RESPONSE: The Interim Measures Work Plan (IMWP) specified a media cleanup standard of 400 mg/kg for lead. Interim measures were conducted in accordance with the IMWP. EPA approved the Interim Measures Report (IMR) for the OPR on 9/22/08. Section 3 of the IMR contained the following conclusion:

"This IM Report summarizes the work performed at NSWC Crane, SWMU 7 by D&T and the verification and confirmation sampling conducted by Tetra Tech.

Based on the results of confirmation sample analyses performed by the fixed-base laboratory (see Appendix D), the residual soil remaining within the Range 1 and Range 2 berms at the OPR is acceptable considering the United States Environmental Protection Agency (U.S. EPA) residential soil levels for lead. No further excavation of soil is required."

Comment 2:

Referring to page 2-10, the MCGs for lead are identified as 192 mg/kg and a "no soil remaining with a lead concentration greater than 652 mg/kg." The 652 mg/kg value appears to be the plant PRG from the SWMU 16 toxicity study, although this is not explicitly stated in the IMWP. The plant PRG from SWMU 16 was influenced by soil pH and the Navy would need to provide soil data that shows typical soil pH at UXO 7 is in the range of 7 to 7.5. The lead NOEC and LOEC samples used to develop the plant PRG at SWMU 16 had pH values of 7.54 and 7.33, respectively. If the typical soil pH for SWMU 7 (UXO) is closer to 6, a lower plant PRG needs to be considered.

RESPONSE: While the Navy indicated in the SWMU 16 toxicity study report that soil pH appeared to influence the plant growth in the toxicity test, the PRG was not adjusted by the soil pH. In fact, the Navy conservatively agreed to a PRG for plants even though it was likely that a portion of the toxicity was due to low pH. It is not clear how the plant PRG would be modified if the pH in the soil at UXO 7 was closer to 6.0 because there is not a direct correlation between pH and the PRG. That being said, the soil pH in five recently collected soil samples at UXO 7 were measured at 5.68, 6.71, 6.94, 6.97, and 7.87 standard units for an average of 6.8. Therefore, the average pH is close to 7.0. Also, there are only a few

locations at UXO 7 with lead concentrations between 600 and 650 mg/kg remaining at the site. Most of the remaining lead detections will be less than 600 mg/kg with the majority of those being less than 400 mg/kg. Therefore, any potential impacts to plants would be minimal and not ecologically significant. This is especially true because the site is already grass covered and it is unlikely that plants are currently being significantly impacted. Moreover, the samples at UXO 7 are very close to each other, so any potentially impacted area would tend to be very small.

Comment 3:

Referring to the last full paragraph on page 2-5, the human health and ecological risk assessments should be further refined after completion of this IM removal action to reflect the current site risks. This may be done in an addendum to the RFI's currently created (2009 and 2012) or in a Corrective Measures Proposal.

RESPONSE: The IMR will contain refinements of the health and ecological risk assessments based on residual contamination remaining after completion of the IM removal actions.

Comment 4:

Referring to the last full paragraph on page 2-10, the text states that analytical results from the RFI indicated an excess human health residential exposure from lead. This does not seem to be the conclusion of either the 2009 RFI or the 2012 RFI Addendum. Please clarify the basis for this statement in the IMWP.

RESPONSE: The conclusions regarding health risk in the 2009 RFI were based on the data available at that time. Additional data became available after the 2009 RFI was submitted. These data showed that soil lead concentrations were higher. Within the Central Area of the Northern Zone, the average lead concentration was 401 mg/kg. Section 4.0 "Human Health Risk Assessment" of the December 2012 submittal included the statement, "However, this concentration would not be expected to result in exceedence of US EPA's goals for lead." This statement was based on a comparison of the average concentration to the 400 mg/kg criterion. The last sentence of Section 4 stated "Because the attainment of ecological MCGs will significantly reduce lead concentrations in the northern Zone Central Area to below 278 mg/kg it was not necessary to reevaluate lead risks."

Section 2.3.3 "Lead Risk Reduction and Mitigation in UXO 7 Former Old Rifle Range Soil" paragraph 2 has been revised to read as follows:

The Drainage Area, 400-yard Berm Area, and Dirt Mound Area within the Northern Zone of the ORR at UXO 7 were initially investigated as part of an RFI in 2007. Additional samples were collected to delineate lead contamination. Average lead concentrations were 401 mg/kg with some concentrations as high as 4,000 mg/kg. The source of lead contamination detected in soil from these areas is a result of lead bullets fired at the range.

Comment 5:

Referring to the proposed excavations and Table 3-3, the Navy is not proposing to collect post excavation confirmation samples. For each excavation area (excluding the removal of the dirt mound area), please identify how the characterization sampling performed provides an equivalent level of useful data on residual contaminant concentrations for decision-making and risk assessment for the excavation floors as previous Navy verification sampling approaches (e.g. MFA Battery IMWP, Mine Fill B IMWP). Propose rationale for not collecting sidewall samples at the excavation areas. In some areas, sidewall sampling may be warranted to collect data for risk assessment purposes or additional excavation at the Navy's discretion (e.g. northernmost area of the west trap range as shown on Figure 2-7).

RESPONSE: The Navy will conduct limited composite soil sampling for residual lead and soil PAH contamination within proposed excavation sidewalls and floors, as appropriate, to support the reassessment of risks within the UXO 7 hot spot soil removal subareas. If there are sufficient existing sample data to characterize the concentrations of PAH or lead in a proposed excavation floor or excavation sidewall (based on a previously collected soil sample at a known point), then additional sampling will not be required to assess exposure risks for those excavation limits. Soil samples will be collected in accordance with an approved sampling plan. The post-excavation soil analytical data will be used to support the reassessment of human and ecological receptor exposure risks due to the residual (post-removal action) concentrations of lead and PAHs in the soil at UXO 7 and will confirm that post-removal action exposure risks at the UXO 7 site are within the acceptable risk range.

Comment 6:

Section 2 discusses the BaP equivalents approach procedure, but it does not cite a document where the Navy introduced their plan to use the procedure. Also, please describe how the Navy calculated a Risk Based Screening Level corresponding to a risk level of 1×10^{-4} , or 1.5 mg/kg BaP equivalent concentration. The Navy appears to evaluate PAH for the 7 carcinogenic PAHs only. It's not clear if the non-carcinogenic PAHs (e.g., fluoranthene, naphthalene) were including in the sample analysis.

RESPONSE: The samples analysis data included non-carcinogenic PAHs. Tables 6A, 6B, and 6C contain the data including a comparison the EPA RSLs for the non-carcinogenic PAHs. None of the non-carcinogenic PAHs were present in concentrations above their respective screening levels. The non-carcinogenic PAHs were present only in samples which also contained carcinogenic PAHs.

(1) - The screening criteria was selected from the United States Environmental Protection Agency (USEPA)

Regional Screening Levels (RSLs) for residential and industrial soil (USEPA, 2013).

(2) - No RSL is available for acenaphthylene; therefore, the RSL for Acenaphthene was used as a surrogate.

(3) - No RSL is available for Fluorene; therefore, the RSL for Fluoranthene was used as a surrogate.

Indicates a cancer risk exceeding 10-4

Indicates a cancer risk exceeding 10-5

Compounds not included in calculation for the BaP equivalent

J - Estimated concentration

U - Concentration is less than the laboratory detection limit

UJ - Concentration is less than the laboratory detection limit, which is estimated

mg/kg - Milligram per kilogram

NC - Not considered

(1) - The screening criteria was selected from the United States Environmental Protection Agency (USEPA) Regional Screening Levels (RSLs) for residential and industrial soil (USEPA, 2013).

(2) - No RSL is available for acenaphthylene; therefore, the RSL for Acenaphthene was used as a surrogate.

(3) - No RSL is available for Fluorene; therefore, the RSL for Fluoranthene was used as a surrogate.

Indicates a cancer risk exceeding 10-4

Indicates a cancer risk exceeding 10-5

Compounds not included in calculation for the BaP equivalent

J - Estimated concentration

U - Concentration is less than the laboratory detection limit

UJ - Concentration is less than the laboratory detection limit, which is estimated

mg/kg - Milligram per kilogram

NC - Not considered

(1) - The screening criteria was selected from the United States Environmental Protection Agency (USEPA) Regional Screening Levels (RSLs) for residential and industrial soil (USEPA, 2013).

(2) - No RSL is available for acenaphthylene; therefore, the RSL for Acenaphthene was used as a surrogate.

(3) - No RSL is available for Fluorene; therefore, the RSL for Fluoranthene was used as a surrogate.

Indicates a cancer risk exceeding 10-4

Indicates a cancer risk exceeding 10-5

Compounds not included in calculation for the BaP equivalent

J - Estimated concentration

U - Concentration is less than the laboratory detection limit

UJ - Concentration is less than the laboratory detection limit, which is estimated mg/kg - Milligram per kilogram

NC - Not considered

**RESPONSES TO
EPA COMMENTS DATED SEPTEMBER 13, 2013
ON RESPONSES TO EPA COMMENTS DATED AUGUST 8, 2013
ON NSA JULY 2013 NSA CRANE UXO 7 IMWP**

Issue 1 - Thanks for the responses. I'm wondering if it would make sense to incorporate the sampling plan into the IMWP so it's contained within the work plan versus another separate document?

Response: The sampling plan will be included in the UXO 7 IMWP as a stand-alone appendix. The plan will be in the form of Field Task Modification Request (FTMR). The objectives of the sampling will be described. Tables listing the samples and figures showing the sample locations will be included.

It should be noted that the objective is to provide data for use in the re-evaluation of human health and ecological risks. These data will not be used to determine whether a specific media cleanup standard (MCS) has been attained.

Section 3.7 and Appendix D have been added to the UXO 7 IMWP to address this comment, as indicated in the italic text below:

3.7 EXCAVATION SAMPLING

The UXO 7 interim measures are being conducted to mitigate human health and ecological risks. During the proposed soil removal actions at UXO 7, soil samples will be collected from excavation sidewalls and floors, as necessary, and analyzed for lead and PAHs to provide the Navy data on the adequacy of the risk mitigation effort while the EMAC is still in the field. Appendix D contains the Sampling Plan for use in the UXO 7 soil excavation sampling. After the interim measures are completed, the post-removal action soil concentrations for PAH and lead concentrations at UXO 7 will be formally reassessed. The UXO 7 Interim Measures Report will include the screening level risk assessment and should confirm that the soil removal action successfully mitigated the excess human health and ecological risks at UXO 7.

Issue 2 - Comment 1: I don't view the approval of an Interim Measures Report as a formal Agency decision of NFA for the OPR. So given that small arms ranges are being investigated under the Navy Military Munitions Response Program, do you now view the OPR as part of unexploded ordnance (UXO) 7 and are you planning to include OPR in a CMP for UXO 7?

Response: Section 3 of the OPR Interim Measures Report (IMR) stated:

"Based on the results of confirmation sample analyses performed by the fixed-base laboratory (see Appendix D), the residual soil remaining within the Range 1 and Range 2 berms at the OPR is acceptable considering the United States Environmental Protection Agency (U.S. EPA) residential soil levels for lead. No further excavation of soil is required."

The soil MCS was 400 mg/kg for lead. This MCS was met throughout the area of excavation. The objective of the Old Pistol Range IM was to meet an MCS based on protection of residential receptors. Ecological concerns were not considered. However, assuming that EPA accepts the proposed

MCS for soil lead at UXO 7 (192 mg/kg average and 652 mg/kg maximum) then it would also have been met at the OPR. The UXO 7 interim measures are being conducted to mitigate human health and ecological risks in the soil and eventually support a site recommendation for No Further Action (NFA) at UXO 7. To improve consensus on the site regulatory status of the Old Pistol Range (OPR), a brief discussion describing the previously completed interim measures at the OPR and the resulting post-removal action soil conditions will be added to UXO 7 IMR. A separate site recommendation for NFA at the OPR will be included in the UXO 7 IMR.

Issue 3 - Comment 2:

- a. **The Navy needs to explain origin of the 652 mg/kg lead concentration and why it's appropriate for this site.**

Response: The 652 mg/kg lead value is the plant PRG from the Technical Memorandum, Ecological Media Cleanup Goals, SWMU 16 Surface Soil. Although the likely source of metals at SWMU 16 was ash from the incinerator, the PRG is appropriate for use at UXO 7 because the bioavailability of lead from the bullets/shot is not expected to be greater than the bioavailable of lead from the ash.

The following text was added after the second sentence in the last paragraph on page 2-1:

"The MCGs of 192 mg/kg and 652 mg/kg for lead were developed using site specific toxicity/bioaccumulation testing at SWMU 16 at NSA Crane. The 192 mg/kg value is protective of invertivorous birds and the 652 mg/kg value is protective of plants. Although the likely source of metals at SWMU 16 was ash from the incinerator, the PRG is appropriate for use at UXO 7 because the bioavailability of lead from the bullets/shot is not expected to be greater than the bioavailability of lead from the ash."

- b. **Unlike animals, plants lack mobility and exposure is location specific (cannot be averaged over a large area). Also pH is measured on a log scale and simple averaging is not appropriate.**

Response: As stated in Section 2.3, Lead Risk Reduction and Mitigation in UXO 7 Former Old Rifle Range Soil, on page 2-10: "The MCGs for lead are reduction of lead concentrations to below an average of 192 mg/kg, with no soil remaining with a lead concentration greater than 652 mg/kg." Therefore, the plan was not to average the lead concentrations for comparison to the plant PRG. That being said, it is possible to have a few isolated locations with exceedences of the plant PRG, while still being protective of the plant population.

The Navy realizes that a simple averaging of the pH values is not technically correct, however, the purpose of the averaging was really to show that most of the pH values were close to 7. As discussed in the original response to Comment 2, the soil pH in five recently collected soil samples at UXO 7 were measured at 5.68, 6.71, 6.94, 6.97, and 7.87 standard units. Therefore, most values were close to 7.0, even though the true average may be closer to 6.0. No changes will be made to the IMWP based on this comment.

c. Toxicity tests at SWMU 16 had no effect on monocots (e.g., rye grass), but dicots (e.g., red clover) showed adverse effects. Sample SS114 showed some risk to monocots, but had a pH of 5.66. This may explain observed plant growth at UXO 7 by the Navy to favor monocots (grasses). Dicots are known to take up divalent ions more efficiently than monocots (Woodward et al. 1984, Plant and Soil vol 79 issue 2 pp 169-180).

Response: The Navy believes that reviewer means that Sample SS114 showed some risk to dicots, not monocots. The Navy agrees that Sample SS114 had a pH of 5.66, which may have been responsible for the observed toxicity in the red clover because the concentrations of metals in that sample were relatively low. The concentrations were expected to be low because Sample SS114 was collected from a reference location and not impacted by site activities, so it is more likely that the observed toxicity was related to the lower pH, vs. the metals concentrations. The Navy reviewed the referenced article and noted that the study was evaluating the root cation exchange capacity (CEC) to show that plants with greater root CECs, such as in the dicots they studied, accumulated more polyvalent metals. Note that lead was not one of the metals included in their study, although it is likely to have followed a similar pattern. That being said, accumulating more metals does not necessarily indicate that toxicity will be greater in those species, because plants have detoxification mechanisms that allow certain plants to accumulate high levels of metals without having toxic effects. The PRGs that were developed were based on metals concentrations in soil, not tissue, so the different accumulation rates for lead in the two species tested at SWMU 16 would not change the PRG. Also note that rye grass was selected as one of the test species because it was relevant to the site and the selection of that species was agreed to by EPA in a February 2, 2010 e-mail. The Navy also agreed to test red clover to bracket potential adverse effects. No changes will be made to the IMWP based on this comment.

d. The plant lead PRG developed for SWMU 16 was based on NOEC and LOEC with corresponding soil pH of 7.33 and 7.54 (samples SS102 & SS104), respectively. If toxic (LOEC) samples were restricted to soils pH in the range of 6.0 to 7.5, the LOEC selected in Table 11 for the SWMU 16 Tech Memo (Ecological Media Cleanup Goals) would be sample SS106 with 318 mg/kg lead (pH of 6.02). If sample SS106 was used for the LOEC, the PRG would be 454 mg/kg lead.

Response: The technical basis for restricting toxic samples to a pH of 6.0 to 7.5 is not known. However, if Sample SS104 was excluded from the toxic data set, then no LOECs would be developed because no concentrations in the toxic sample data set would be greater than the maximum concentration in the non-toxic data set. The lead concentration of 318 mg/kg in sample SS106 cannot be a LOEC because by definition, it has to be greater than the NOEC, which is 648 mg/kg. Also, note that three of the lead concentrations in the non-toxic data set were 422 mg/kg, 452 mg/kg, and 648 mg/kg, indicating that lead was not toxic at levels greater than 318 mg/kg. In fact, because the NOEC of 648 mg/kg is almost identical to the LOEC of 656 mg/kg (well within the range of field and laboratory variation), there is considerable uncertainty in whether lead was even the source of the observed toxicity in the toxicity test. However, the Navy had agreed to conservatively assume that the toxicity was due, in part, to the lead in the sample, which is why a PRG was developed for lead. For all these reasons, the Navy does not believe that it is appropriate to restrict the toxic data set to samples within a pH range of 6.0 to 7.5 to obtain a LOEC that is lower than the NOEC so no changes will be made to the IMWP based on this comment.

Subject: UXO 7 Composite Sampling FTMR#3

- 1) You should run a new correlation calculation on this newly collected XRF/lab data to account for potential variability in XRF calibration, etc.**

RESPONSE: A new correlation calculation will be run once sufficient field XRF and laboratory data collected during the interim measures is available. In the interim, data from historic calculations will be used as listed in FTMR Table 3. Once the new correlation data is available, existing Table 3 will be replaced. The comparisons made to the current version of Table 3 will be checked.

The last paragraph of the FTMR Section titled "Analysis" now reads as follows:

Lead samples will be initially analyzed in the field by XRF techniques. The field XRF data will be converted to laboratory-equivalent data using historical field/laboratory correlation data for UXO 7. The correlation between field XRF readings and laboratory-derived lead concentrations for previous soil samples collected at UXO 7 is presented in Table 3. *The data from Table 3 will be used only until sufficient data is available from the interim measures sampling to establish new correlations or verify the existing correlations. If new correlations are established based on interim measures data then comparisons made to the existing Table 3 will be reevaluated.* The soil lead concentration data collected from excavation sidewalls and floors during the IM will be evaluated by the Navy to determine whether additional excavations may be warranted to address excess risk.

- 2) What criteria will you be using to decide that the existing characterization of the lead and PAH already collected is sufficient in lieu of new sidewall or floor sampling?**

RESPONSE: Samples will be collected at all sidewalls and floors in all cases where data are not available at the vertical or horizontal boundary.

The first sentence of paragraph 1 and 2 of the FTMR Section titled "Sample Collection" has been modified, respectively, to read as follows:

"Samples will be collected at all excavation sidewalls in all cases where data are not available at the horizontal boundary of the excavation."

"Samples will be collected from all excavation floors in all cases where data are not available at the vertical boundary of the excavation."
